

DNA Jewelry

Each color of bead represents one of the four DNA bases (red for Thymine, green for Adenine, blue for Cytosine and yellow for Guanine). With the colored beads strung together in the correct sequence the necklace spells out the unique DNA code of a gene for the animal represented by the charm. These beautiful, sparkling necklaces and bracelets are sure to catch your eye and are a fun way to own a special piece of jewelry plus support the important work that CRES does.
